DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 3, 6-7, and 9-13 are allowed.

Regarding Claims 1 and 6, Li *et al.*, U.S. Patent No. 6,591,301, discloses a method for controlling the processing of messages by a packet-based network gatekeeper in order to prevent said gatekeeper's processor from crashing, wherein messages relating to calls in progress are handled preferentially relative to messages relating to new calls (Abstract, Column 4 Lines 17-29, Column 5 Lines 19-29, Fig. 2). If the frequency of messages associated with new calls exceeds a certain threshold, then a practice known as "in-progress message favoring" may be invoked (Column 11 Lines 23-32). The message type (that is, a message associated with a new call or a call in progress) is determined by examining the message header (Column 11 Lines 33-45, Fig. 11). If the message is associated with a call in progress, it is placed in a progress queue and processed (Column 11 Lines 59-64). If the message is associated with a new call, then the message is discarded (Column 11 Lines 64-65). If in-progress message favoring has not been invoked (that is, the aforementioned threshold has not been exceeded), then messages associated with new calls are processed. The gatekeeper's CPU load and available memory are criteria used in the method of the invention (Column 5 Line 49 to Column 6 Line 3, Column 8 Lines 4-26).

Li *et al.* does not expressly disclose the handling of situations whereby either a serving general packet radio service support node (SGSN) or a base station system

(BSS) is re-started.

Haumont *et al.*, U.S. Patent No. 6,233,458, teaches that a SGSN may need to be shut down after a malfunction or due to a high level of traffic in a packet-switched communication network (Column 4 Lines 31-49, Column 6 Lines 7-13, Fig. 6).

Ekman *et al.*, U.S. Patent No. 5,960,355, discloses a method pertaining to a wireless telecommunication system (Abstract, Column 5 Lines 18-30, Fig. 1). Procedures for handling the restart of a radio base station are disclosed (Column 9 Line 66 to Column 10 Line 13, Fig. 4).

Neither Li *et al.*, nor Haumont *et al.*, nor Ekman *et al.* expressly discloses a method whereby a BSS or a SGSN avoids overloading a processor in said BSS or said SGSN, after a re-start of said BSS or said SGSN.

No prior art reference was found that discloses this feature. Therefore, Claims 1 and 6 are allowable over the prior art. Claims 3 and 7, 9-13 depend on Claims 1 and 6, respectively, and are therefore also allowable over the prior art.

Response to Arguments

2. Applicant's arguments, filed 28 March 2007, have been fully considered and are persuasive. The 35 U.S.C. 103(a) rejections of Claims 1, 3, 6-7, and 9-13 have been withdrawn.

EXAMINER'S AMENDMENT

3. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided

by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

- Claim 3 is renumbered as Claim 2.
- Claim 6 is renumbered as Claim 3.
- Claim 7 is renumbered as Claim 4.
- Claim 9 is renumbered as Claim 5.
- Claim 10 is renumbered as Claim 6.
- Claim 11 is renumbered as Claim 7.
- Claim 12 is renumbered as Claim 8.
- Claim 13 is renumbered as Claim 9.
- The instances of "6" in Line 1 of originally numbered Claim 7, originally numbered Claim 9, originally numbered Claim 11, and originally numbered Claim 12, are all deleted and replaced with "3".
- The instance of "9" in Line 1 of originally numbered Claim 10 is deleted and replaced with "5".
- The instance of "12" in Line 1 of originally numbered Claim 13 is deleted and replaced with "8".
